

Dynamic 2D Barcoded Forms for Kofax Capture®

Data Entry Automation for “Fill & Print” PDF & HTML Forms

ImageTech Systems announces an end-to-end automated forms processing solution for “fill and print” paper forms utilizing dynamic 2D barcode technology that can save its clients hundreds to thousands of hours of manual data entry.

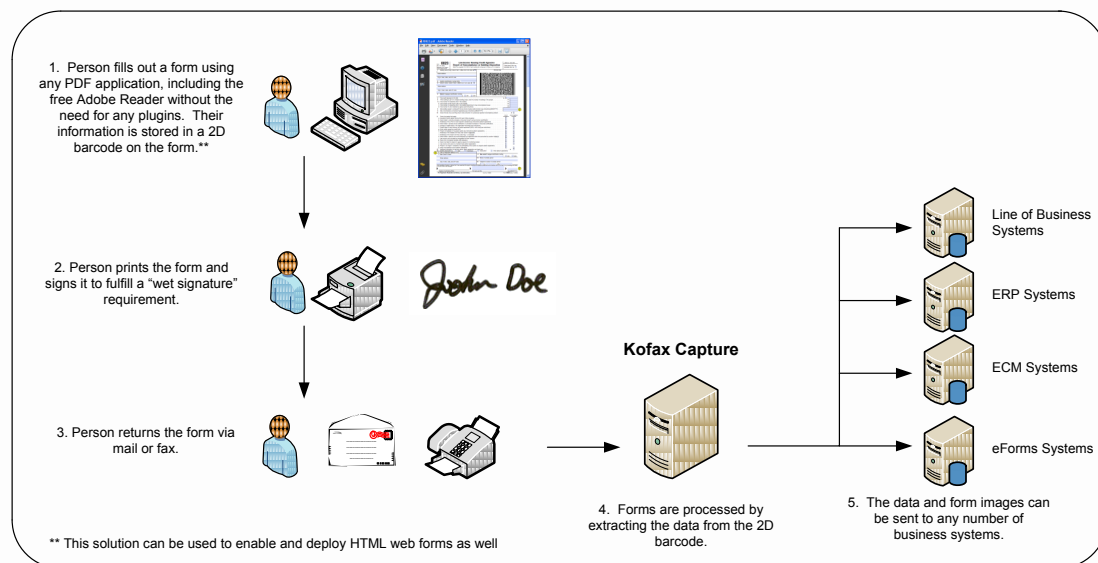

Even in the 21st century, organizations are over-run with paperwork. One of the biggest costs is the data

entry process from these paper documents into mission critical Line-of-Business systems. Some organizations look to an all electronic solution, however that is not always realistic or officially permitted by law. Plus, many trailing documents still arrive and need to be processed in paper format.

The Dynamic 2D Barcoded Forms for Kofax Capture® solution provided by ImageTech Systems bridges the gap between paper and electronic forms with a solution that supports capturing the paper component of an electronic forms process—including the **all important “wet signature”** required by many processes. The solution enables organizations to streamline paper-based business processes and significantly reduce errors, time, and costs associated with manually re-keying data from paper or faxed forms. This has applicability with forms for transactions such as applications, requests for information, authorizations, etc.

HOW IT WORKS

100% Accuracy.
No Data Entry.
Complete
Automation.

Forms Design

This solution uses proven 2D (two dimensional) barcode technology to automate the capture of user-supplied data from "fill and print" PDF & HTML forms. Forms can be created by third party tools provided by Adobe® and others to design and create fillable PDF and/or HTML forms. These forms can be embedded with ImageTech's dynamic 2D barcode generation technology to capture the data filled in by end-users. This ensures that when the barcode is read, all of the information on the form is automatically extracted - eliminating the need for manual data entry or OCR/ICR recognition processing.

Forms Processing

Forms can be scanned or imported into Kofax Capture for automated processing. Using ImageTech's 2D barcode extraction module for Kofax Capture, the barcode can be scanned and the data is extracted with 100 percent accuracy and routed to enterprise business applications or enterprise content management systems. This solution enables organizations to streamline paper-based and online business processes and significantly reduce errors, time, and overall costs associated with manually re-keying data from paper forms and faxes.

Key Benefits

- Cost reduction
- Faster cycle times for forms processing
- Reduce labor by reducing data entry, validation, and quality control clerks
- Rapidly supply business applications with data from forms
- Minimize onsite storage requirements
- Reduce administrative maintenance of templates required when doing OCR for data extraction
- Automate forms processing across the organization without increasing staff
- 100% accurate capture of paper-based form data

Who Can Benefit?

- Financial
 - Mortgage processing
 - Account applications
 - Brokerage
 - Account maintenance
- Insurance
 - Claims processing
- Healthcare
 - Admissions
- Government
 - Claims processing
 - DMV processing
- And many other industries
